

Cizer.Net Reporting 4.0 Developer Edition Adds Zero-Client-Footprint Reporting with Microsoft SQL Server Reporting Services for ASP.Net Applications

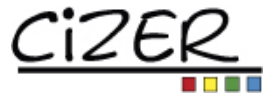

Ashburn, VA - Nov 14, 2006-- Cizer Software today announced the release of Cizer.Net Reporting 4.0 Developer Edition to provide both ad hoc and production style reporting in a zero-client-footprint for use with Microsoft SQL Server Reporting Services. As an industry favorite for the deployment of Microsoft Reporting Services to non-technical business users for robust self-service reporting, CNR now provides a set of web services that allow ASP.Net developers to add web-based reporting with no client install required. Now, ASP.Net developers can add full reporting functionality to build and run reports in a matter of days, with embedded links from their own application to the popular and easy-to-use CNR reporting suite.

“This new release provides more functionality than ever before in the Cizer Quick Query module,” said Marc Waybright, CNR’s Product manager. Now developers can give their Business users that have absolutely no knowledge of SQL, the ability to create robust self-service reports such as drill-down and other report types, with enhanced formatting, charting and logos, as well as the addition of Summary Reporting - all via point-and-click design without waiting for an IT or database expert to provide them with the data and reports. And now it can be integrated to applications in a matter of days with our new web services kit.”

ISV’s (Independent Software Vendors) such as Redwood Analytics, a leading provider of applied business intelligence to the legal industry, have chosen Cizer.Net Reporting to include in their product offering for faster delivery to market. “We felt it was important in this release to address the requirement for “drop-in” world-class reporting so that our ISV Partners and our customers running corporate development shops could rapidly deliver seamless zero-client footprint reporting to their clientele,” said Asim Pandey, Chief Development Officer of Cizer Software. “The response to our Web Services Developer Toolkit during beta was very positive, and we believe the application development teams - both commercial and corporate - searching for a reporting solution will find CNR to be powerful yet easy to implement with their own software.”

About Cizer Software

Cizer Software, the leading vendor of pure web-based reporting for SQL Server Microsoft Reporting Services, has delivered database reporting solutions and expertise since 1983, citing many large

government and commercial organizations among their customer base. The Cizer.Net Reporting Suite provides an unprecedented value for Business Intelligence running on the Microsoft platform. With the release of CNR 4.0 in August 2006, Cizer introduces its Enterprise Edition of CNR, with the power to scale across large enterprises, serving as a front-end to large data warehouses. Both CNR Standard and CNR Enterprise remain pure browser, zero client footprint products, requiring nothing on the client user machine except Internet Explorer 6.0 or higher.
