

Cizer.Net Reporting Delivers Self-Service Presentation-Style Reporting to the Enterprise - still with Zero-Client Footprint Install

Ashburn, VA - Sept 1, 2006-- Cizer Software today announced the release to market of Cizer.Net Reporting 4.0 - now in both Standard and Enterprise Editions, with Enterprise delivering powerful Multi-Level Administration and Dynamic Data Sources. Both Standard and Enterprise editions enjoy more functionality than ever before within the Cizer Quick Query module to allow enhanced formatting, with the addition of charting and logos, as well as the addition of Summary Reporting - all via point-and-click design with no knowledge of SQL required.

“The new Enterprise edition of [Cizer.Net Reporting 4.0](#) takes our product to a whole new level of sophistication and scalability, while still maintaining the simplicity of use that’s made us so popular with Business Users,” said Marc Waybright, CNR’s Product Manager. “The expanded capabilities in Quick Query for both Standard and Enterprise have been especially well-received since CQQ has become the non-technical report builder’s tool of choice.”

CNR 4.0 now also has seamless integration with Microsoft’s Business Scorecard Manager, the Scorecard tool from the Microsoft Office group that’s rapidly growing in popularity. Doug Harts, CTO of Cizer Software who has been working closely with the Microsoft BSM team to educate State and Local Governments about [Data Driven Performance Management](#), told us that “CNR 4.0’s new connectivity with Microsoft Business Scorecard Manager has been generating a lot of interest in the marketplace. The ability to measure and manage data driven performance by delivering a single integrated web interface to KPI indicators, analytics and deep-dive data reporting now allows organizations to respond even faster and more accurately than ever before. State and Local governments are getting very excited about BI these days, and CNR with BSM makes it a viable option - the solution is powerful, easy to implement, and affordable.”

ISV’s (Independent Software Vendors) such as Redwood Analytics, a leading provider of applied business intelligence to the legal industry, have chosen Cizer.Net Reporting to include in their product offering for faster delivery to market. “We felt it was important in this release to address the requirement for “drop-in” world-class reporting so that our ISV Partners and our customers running corporate development shops could rapidly deliver seamless zero-client footprint reporting to their clientele,” said Asim Pandey, Chief Development Officer of Cizer Software. “The response to our Web Services Developer Toolkit during beta was very positive, and we believe the application

development teams searching for a reporting solution will find CNR to be powerful yet easy to implement with their own software.”

About Cizer Software

Cizer Software, the leading vendor of pure web-based reporting for SQL Server Microsoft Reporting Services, has delivered database reporting solutions and expertise since 1983, citing many large government and commercial organizations among their customer base. The Cizer.Net Reporting Suite provides an unprecedented value for Business Intelligence running on the Microsoft platform. With the release of CNR 4.0 in August 2006, Cizer introduces its Enterprise Edition of CNR, with the power to scale across large enterprises, serving as a front-end to large data warehouses. Both CNR Standard and CNR Enterprise remain pure browser, zero client footprint products, requiring nothing on the client user machine except Internet Explorer 6.0 or higher.
